* { Example of Hierarchical Inheritance }

{ class User }

class Admin — Hierarchy — class Guest

Type of User | Type of User

Annotations in Java

@ Override
@ Deprecated
@ Config @ Bean

Polymorphism :→

Poly — many | morph { lyism } — forms or shapes

↓ doesn't change Role or character changes.

Place	Role
Class	Student
Canteen	Customer
Home	Son

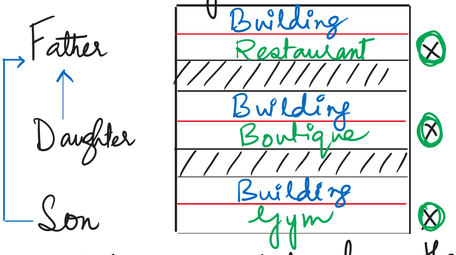
The process by which the same entity / method can behave differently under different scenarios or circumstances is called Polymorphism.

Types of Polymorphism :→

(I) Compile Time | Static Polymorphism | Overloading | Same class
(a) no of parameters (b) return type of parameters

(II) Runtime | Dynamic | Overriding | Multiple Classes

Overriding :→ (Change)



* Taking some info from the parent & using in a different way in multiple child classes.

RBI roi 6.5%

roi ICICI — 7.2%
roi HDFC — 7.9%
roi IDBI — 6.2%

It should happen in multiple classes & for safety we use @ Override annotation.

Nested Classes | Inner Classes :→

(I) Member Inner Class ✓
(II) Static Inner Class ✓
(III) Local Inner Class ✓
(IV) Anonymous Inner Class ✓

class A{
class B{
}
}
