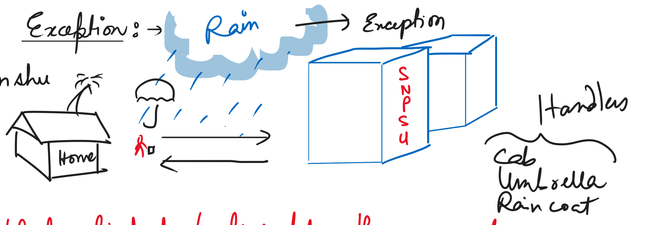
* Destructor :→ Used to destroy objects from the Heap Memory. Present in C++ & has to be invoked manually.

* In Java, we don't have a Destructor, earlier we used the finalize() method from the java.lang.Object class by overriding it. Now in latest versions it is marked as Deprecated.

* So, Garbage Collection is done by the JVM in Java. We don't have to do anything.

Exception Handling

Exception :→ Rain → Exception



Anything that disturbs / disrupts the normal flow of code execution is known as exception.

The process of handling these exceptions (gracefully) is called exception handling.

Throwable → (Object)

(Base Exception)

- Errors (Cannot be handled)
  - Compile Time
  - Runtime
- Exceptions (Can be handled)
  - Checked (Known)
  - Unchecked (Unknown)
  - User defined (Custom)

{ try, catch, throw, throws, Throwable, finally }

(Exception Hierarchy)

C++	Java	Python
try {	try {	try :
} catch ( ) {	} catch ( ) {	except :
} destructor() } released here! }	} finally { used to release OS resources }	finally : { same }

Important Keywords :→ try, catch, throw, throws, finally, Throwable.

* final (keyword) → equivalent to constant
* finally{} (block) → It is a block in Exception Handling (Always executes)
* finalize() (method) (System.gc();) → It is a method in the object class which was used for Garbage Collection. It is deprecated now.
